Exam 05: Study Guide

This exam is very similar to the fourth exam, with ten questions pulled from the worksheets with some questions asking you to justify the results (since you will likely already know the results from the handout).

I highly recommend bringing a calculator to the exam in order to answer questions that involve applying the tail inequality bounds. Also, you will want to memorize the change of variables formula and the formula for the kth order statistic. These are not on the handout and will be needed for the exam!
